Engineered for Speed
QA/QC and R&D Solution
Simply powerful

The new S neox outperforms existing optical 3D profiling microscopes in terms of performance, functionality, efficiency and design, providing Sensofar with a class-leading areal measurement system.

Easy-to-use

Sensofar is continuously working to provide the most incredible experience to our customers. With the fifth generation of the S neox systems, the goal has been to make it easy to use, intuitive and faster. Even if you are beginner user, the system can be managed with just one click. Software modules have been created to adapt the system to the user requirements.

Faster than ever

Everything is faster than before with new smart and unique algorithms and a new camera. Data acquisition is taken at 180 fps. Standard measurement acquisition is 5X faster than before. Making the S neox the fastest areal measurement system in the market.
Markets and applications

- Aerospace & Automotive
- Energy
- Forensics
- Medical Devices
- Microelectronics
- Micromanufacturing
- Semiconductors
- Surface Finish
- Tooling Industry
- Optics
- Watch Manufacturing
**Quality control**

Automated modules have been created to facilitate all QC procedures. Ranging from operator access rights control, recipes, compatibility to barcode/QR readers, and customized plugins from our proprietary SensoPRO software to generate pass/fail reports. Our optimized solutions are able to work in QC environments due to their flexibility and easy-to-use interface, which can be programmed to work 24/7.

---

**Traceability**

Every S neox is manufactured to deliver accurate and traceable measurements. Systems are calibrated using traceable standards following the ISO 25178 standard for: Z amplification factor, XY lateral dimensions, flatness error, as well as parcentricity and parfocality.
Surface parameters are calculated according to ISO25178 and ISO4287. Height, Spatial, Hybrid, Functional and Volumetric parameters are computed.

Research & Development

With Sensofar’s 3-in-1 approach—a single click in SensoSCAN switches the system to the best technique for the task at hand. The three measurement techniques found in the S neox sensor head—Confocal, Interferometry, Ai Focus Variation—each contribute critically to the versatility of the system and help to minimize undesirable compromises in the data acquisition. The S neox is ideal for all lab environments, without limitations.

Since 2007, Sensofar has been member of the Technical Committee of the International organization for Standardization (ISO/TC213)
Guided system

SensoSCAN
Software drives the systems with its clear and intuitive user-friendly interface. The user is guided through the 3D environment, delivering a unique user experience.

Sample Navigation
An overview tool helps the user to inspect the sample during measurement preparation, check measurement positions before acquisition as well as assist in the automation procedure. Working with high magnification will be easier, as you will know where you are at every moment.

Auto 3D Function
Selecting 3D Auto function, the SensoSCAN software automatically determines the correct illumination and the appropriate measurement range, and then performs the chosen measurement type. A high-quality result can thus be obtained within just a few seconds.

Analysis & Reporting
It is also possible to create analysis templates to apply pre-determined filter and operator configurations to repeated measurements. And finally, obtain a clear and well-structured report for each measurement, showing the 3D data, a 2D profile and all the ISO parameters.
Extended measurements module

SensoSCAN’s extended measurements module allows the user to easily define the measurement layout on the surface by means of the overview image. The area can be automatically cropped to rectangular, circular or ring areas of interest. Wide areas up to 500 million pixels are possible. Several scanning strategies such as autofocusing on each field, or focus tracking to minimize vertical scanning range are available.

Automating procedures module

Automated measurements are obtained using the Recipes tool, an easily customizable tool for creating quality control procedures. It is ideal for Quality Control inspection, and it is extremely easy to define procedures for automating measurements with the profile manager tool, sample identification, data exportation and ‘pass or fail’ criteria.

Multiple powerful acquisition settings

Numerous acquisition parameters can be adapted to best suit the intended measurement. For example, various autofocus settings help to reduce the acquisition time, HDR function helps to improve the illumination of complex 3D structures and selectable Z-scan options also provide an opportunity to optimize the acquisition for varying 3D surfaces.
SensoVIEW

SensoVIEW is an ideal software for a broad range of analysis tasks. For applications requiring a more complete analysis suite, advanced software packages are optionally available – SensoMAP and SensoPRO.

Interactive analysis tools

3D and 2D interactive views provide multiple scaling, display and render options. A comprehensive suite of tools for preliminary examination and analysis of 3D or 2D measurements is provided. Critical dimensions, angles, distances, diameters can be measured and features highlighted with new annotation tools.
SensoMAP, based on Mountains technology from Digital Surf, is an extremely powerful tool for analysis and reporting. SensoMAP software is completely modularly adaptable to customer requirements. Two levels (standard and premium) and several modules (2D, 3D or 4D modules, Advanced Contour, Grains & Particles, Statistics and Stitching) are available.

Sequential operators

A comprehensive set of operators provides the opportunity to retouch data points, restore non-measurable data, remove form (plane, sphere, polynomial), apply a range of filters and/or generate alternative layers by cropping, subtracting or extracting a profile. It is also possible to create analysis templates to apply pre-determined filter and operator configurations to repetitive measurements.

SensoPRO

It has never been so easy to perform fast quality control in a production line. Thanks to SensoPRO, the operator in the production line only needs to load the sample and follow guided instructions. Plug-in-based data analysis algorithms provide a high degree of flexibility. New modules can be easily customized to other industry needs.
Confocal profilers have been developed to measure the surface height of smooth to very rough surfaces. Confocal profiling provides the highest lateral resolution, up to 0.14 μm line & space, with spatial sampling can be reduced to 0.01 μm, which is ideal for critical dimension measurements. High NA (0.95) and magnification (150X) objectives are available to measure smooth surfaces with steep local slopes over 70° (for rough surfaces up to 86°). The proprietary confocal algorithms provide vertical repeatability on the nanometer scale.

PSI Phase Shift Interferometry has been developed to measure the surface height of very smooth and continuous surfaces with sub-Angstrom resolution, for all numerical apertures (NA). Very low magnifications (2.5X) can be employed to measure large fields of view with the same height resolution.

CSI Coherence Scanning Interferometry uses white light to scan the surface height of smooth to moderately rough surfaces, achieving 1 nm height resolution at any magnification.

Active illumination Focus Variation is an optical technology that has been developed for measuring the shape of large rough surfaces. This technology is based on Sensofar’s extensive expertise in the field of combined confocal and interferometric 3D measurements, and is specifically designed to complement confocal measurements at low magnification. It has been improved with the use of active illumination to get more reliable focus location even on optically smooth surfaces. Highlights of the technology include high slope surfaces (up to 86°), highest speed (up to 3mm/s) and large vertical range measurements.

Why 3-in-1 tech

No moving parts

The confocal scanning technique implemented in Sensofar’s systems is a Microdisplay Scan Confocal Microscope (ISO 25178-607). The microdisplay creates a rapidly switching device with no moving parts, making data acquisition fast, reliable and accurate. Due to this and the associated algorithms, Sensofar’s confocal technique yields a class-leading vertical resolution, better than other confocal approaches and even better than laser scanning confocal systems.
Why 3-in-1 technologies?

- Ai Focus
- Variation
- Confocal
- Interferometry

Thin film measurement technique measures the thickness of optically transparent layers quickly, accurately, non-destructively and requires no sample preparation. The system acquires the reflectance spectrum of the sample in the visible range, and is compared with a simulated spectra calculated by the software, with layer thickness modification until the best fit is found. Transparent films from 50 nm to 1.5 μm can be measured in less than one second. Sample evaluation spot diameter is dependent on the objective magnification which can be as low as 0.5 μm and up to 40 μm.
**Continuous Confocal**

Revolutionary step in Confocal measurement technology, steadily reducing the acquisition time by a factor of 3. Continuous Confocal mode avoids the discrete (and time-consuming) plane-by-plane acquisition of classical Confocal by simultaneously scanning the in-plane and Z axis. Essential for reducing acquisition times for large area scans and large Z scans.

**Smart noise detection**

S neox uses a detection algorithm (SND) to detect those pixels in which the data is not reliable. In comparison to other techniques that use spatial averaging, S neox does this process pixel by pixel without compromising lateral resolution loss.

**HDR**

High Dynamic Range mitigates reflection and drop-out points on highly reflective surfaces.
Outstanding lateral & vertical resolution

High resolution

Vertical resolution is limited by the instrument noise, which is fixed for Interferometry, but dependent of the numerical aperture for Confocal. Sensofar proprietary algorithms deliver nanometer level system noise for any measurements technique at the highest possible lateral resolution for an optical instrument. The topography shown is a sub-nanometer (0.3 nm) atomic layer. Courtesy of PTB.
DIC observation

Differential Interference Contrast (DIC) is used to emphasize very small height features that has no contrast in normal observation. With the use of a Nomarski prism, an interferential image is created resolving sub-nanometer scale structures not visible in brightfield or confocal images.

High slopes

Numerical Aperture (NA) of the microscope objective limits the maximum measurable slope on optically smooth surfaces, while optically rough, or scattering surfaces, provide signal beyond that limit. Sensofar algorithms are designed to measure up to 71º on smooth surfaces (0.95 NA), and up to 86º on rough samples.
USER CASE STUDIES

"The new S neox is beautifully engineered to make it an outstanding instrument for measuring surface textures. It is amazingly fast and has excellent resolution. The flexibility and combination of Confocal, Interferometry, and Ai Focus Variation, along with excellent analysis options, make it a fantastic tool for a wide range of research and studies, covering many applications, topographies, and materials."

MICROELECTRONICS

Measurements of the initial deflection of a nano pressure sensor for biological applications

In the fabrication of nano pressure sensors for biological applications, the sacrificial layer etching and the sealing of the two membranes separated by a vacuum gap is critical. Knowing the exact timing of the initial deflection of the membrane after the fabrication process is also key. As samples must be under vacuum pressure, measurements with a SEM may alter their initial state. That's why we chose Sensofar's S neox, since we were able to image and measure, in a quick non-destructive way, the deflection of the membranes after manufacturing.

CONSUMER ELECTRONICS

Laser structuring of organic optoelectronic devices

To build large-scale organic light emitting diodes (OLEDs) for luminaires requires an invisible series of connections to reduce the device's current and then to mitigate ohmic losses. Laser-etched lines some with a width of a few micrometers and a depth of about 100 nm were monitored. The S neox allows us to detect if the removal process worked by measuring the thin film layers.
MICROMANUFACTURING

Measurements for femtosecond laser micro-milling and functional texturing

Sensofar’s profiler has outstanding lateral resolution, which is a critical requirement to analyze nano structures over micro structures. This is necessary to be sure that the functional texturing will work properly based on the created texture. With the S neox, we are able to obtain fast and non-destructive measurements to assure the micro-millings are delivered within the correct tolerance.

ARCHAEOLOGY

The use of ochre 40,000 years ago in Africa

To analyze pieces of iron-rich mineral fragments and identify facets of ochre pieces ground on different rocks, the Confocal technology was an ideal technique. With the ability of the S neox to measure large areas and large objects, and the set of filters to treat the 3D images, we are able to focus on the roughness of the usewear. It provides key information on the use of these pigments in those societies, and help establish their function through time and when they were first used symbolically in the history of mankind.
Microfluidic devices have different geometries which can be complex. One of the basic structures that comprise it, is the microchannel. Thanks to the S neox, we can easily characterize the roughness and the critical dimensions of the microchannels fabricated by laser technologies.

MEDICAL DEVICES
Characterization of microchannels manufactured with laser for microfluidic applications

MEDICAL DEVICES
The effect of surgical insertion on dental implant surface topography

Implant research has been focused on the development of new surface treatments to increase surface roughness, aiming to enhance the biological response and ultimately, the osteointegration. The study came to the conclusion that Sensofar’s S neox’s Confocal technology is an effective technique to characterize different locations on a complex threaded dental implant with high resolution.
Stand structure

The S neox is a complete tool. Its design is ideal for obtaining a fast, non-invasive assessment of the micro- and nanogeometry of technical surfaces in multiple configurations. S neox provides the flexibility, durability and efficiency required from the standard setup for R&D and quality inspection laboratories to sophisticated, customized solutions for online process controls, measuring samples up to 300x300 mm$^2$ and maximum height up to 350 mm.

Motorized nosepiece

The motorized nosepiece can hold up to six objectives simultaneously, including brightfield and interferometry objectives. The SensoSCAN software handles the motorized change automatically and corrects automatically any possible parfocality adjustment.
Rotational stage

The Five Axis rotational stage consists of a high-precision motorized rotating A axis with 360° of endless rotation, 1 arc sec positioning repeatability, a motorized B axis, -30° to 110°, 1 arc min positioning repeatability, with limit switch. It is equipped with a System3R clamping system.

Ring light

The Ring light is based on an LED ring for illuminating samples in a uniform and efficient way. It is mounted above and around the objective, the ring light provides increased signal for the Ai Focus Variation technique. This ensures proper illumination at the focal plane.

### System specifications

#### Measuring principle
- Confocal, PSI, ePSI, CSI, Ai Focus Variation and Thin Film

#### Observation types
- Brightfield, DIC, Sequential Color RGB, Confocal, Interferential Phase Contrast

#### Measurement types
- Image, 3D, 3D thickness, profile and coordinates

#### Camera
- 5Mpx: 2442x2048 pixels (60 fps)

#### Total magnification (27" screen)
- 60X – 21600X

#### Display resolution
- 0.001 nm

#### Field of view
- from 0.018 to 6.7 mm (single shot)

#### Max. Extended measuring area
- 10x12 (Max. Resolution); 175x175 (Low resolution) (500 Mpx)

#### Confocal frame rate
- 20 fps (5Mpx); 60 fps (1.2 Mpx)

#### Vertical scan range coarse
- Linear stage: 40 mm range; 5 nm resolution

#### Vertical scan range fine
- Piezoelectric scanner with capacitive sensor: 200 µm range; 0.5 nm resolution

#### Max. Z measuring range
- PSI 20 µm; CSI 10 mm; Confocal & Ai Focus Variation 34 mm

#### X Y stage range
- Manual: 40x40 mm; Motorized: 114x154 mm, 256x215 mm, 302x162 mm

#### LED light sources
- Red (630 nm); green (530 nm); blue (460 nm) and white (575 nm; center)

#### Ring light illumination
- Green ring light compatible with 6 position nosepiece

#### Nosepiece
- 6 position fully motorized

#### Sample reflectivity
- 0.05 % to 100%

#### Sample weight
- up to 25 Kg

#### Sample height
- 40 mm (standard); 150 mm and 350 mm (optional)

#### User management rights
- Administrator, supervisor, advanced operator, operator

#### Advanced Software Analysis
- SensoMAP, SensoPRO, SensoMATCH, SensoCOMP (optional)

#### Power
- Line Voltage 100-240 V AC; frequency 50/60 Hz single phase

#### Computer
- Latest INTEL processor; 3840x2160 pixels resolution (4K) (27")

#### Operating system
- Microsoft Windows 10, 64 bit

#### Weight
- 61 Kg (134 lbs)

#### Environment
- Temperature 10 ºC to 35 ºC; Humidity <80 % RH; Altitude <2000 m

SENSOFAR is a leading-edge technology company that has the highest quality standards within the field of surface metrology.

Sensofar Metrology provides high-accuracy optical profilers based on confocal, interferometry and focus variation techniques, from standard setups for R&D and quality inspection laboratories to complete non-contact metrology solutions for in-line production processes. The Sensofar Group has its headquarters in Barcelona, also known as a technology and innovation hub in Europe. The Group is represented in over 30 countries through a global network of partners and has its own offices in Asia, Germany and the United States.
